# CDAX Application

# Pie Chart Analysis

Module-wise feature distribution and implementation-status evidence review

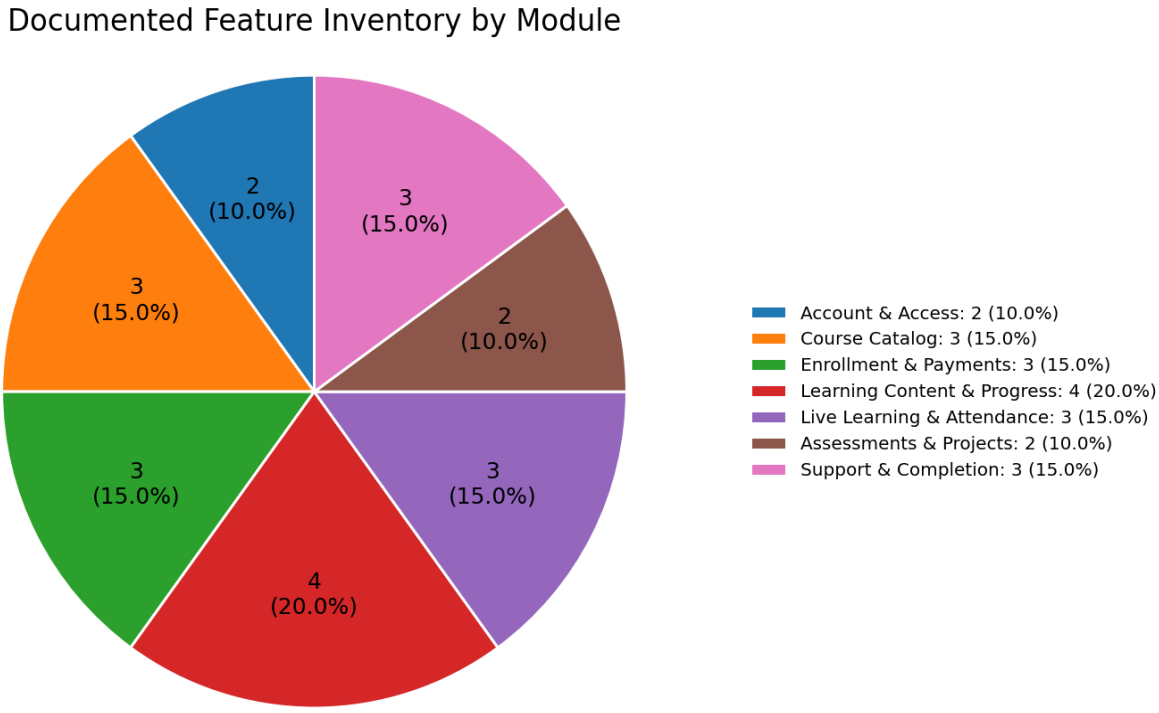

| | |
|---|---|
| **Inventory scope** | 20 feature areas across 7 module groups |
| **Evidence categories** | 10 areas with sample-data/code-excerpt evidence; 10 areas whose implementation could not be verified |
| **Review basis** | CDaX sample workbook, previously shared frontend code excerpts, Data Dictionary, Event Tracking Specification, and related analytics/audit workbooks |

**Important:** This is a documentation-based inventory, not a full production code audit. A data table or event specification does not by itself prove that a user-facing feature is fully implemented or live.

Prepared: 23 October 2026

# 1. Module-wise Feature Distribution

The reviewed inventory contains 20 feature areas grouped into seven module families. This distribution shows the scope represented in the reviewed materials; it does not measure completion or effort.

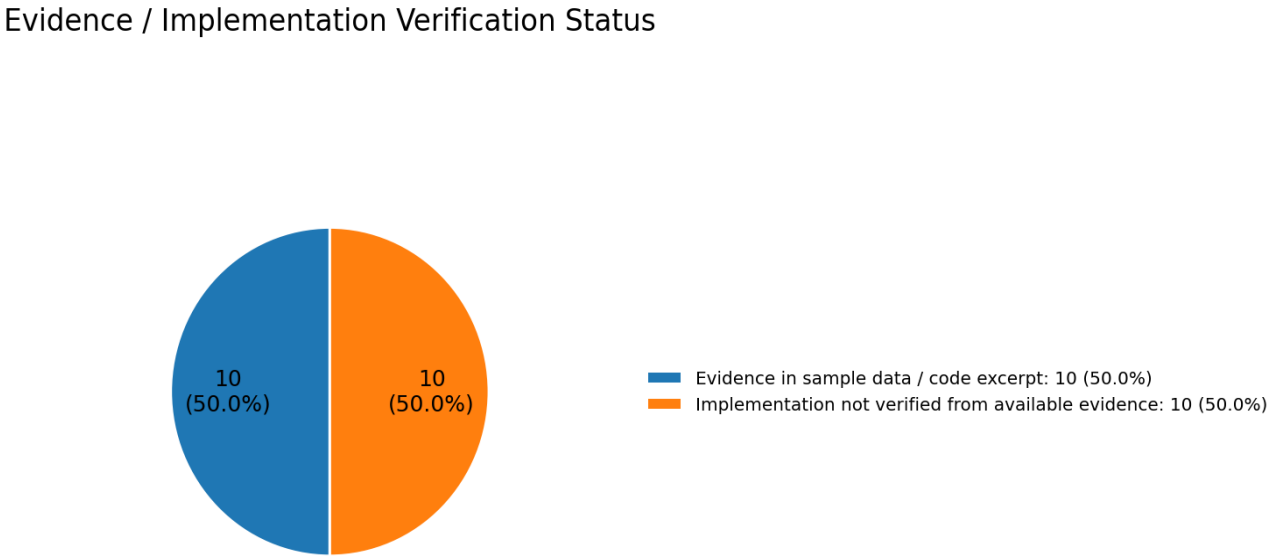

| Module | Feature areas | Share |
|---|---|---|
| Account & Access | 2 | 10.0% |
| Course Catalog | 3 | 15.0% |
| Enrollment & Payments | 3 | 15.0% |
| Learning Content & Progress | 4 | 20.0% |
| Live Learning & Attendance | 3 | 15.0% |
| Assessments & Projects | 2 | 10.0% |
| Support & Completion | 3 | 15.0% |
| **Total** | 20 | 100.0% |

**Key finding:** Learning Content & Progress is the largest group, with 4 of 20 feature areas (20%). This reflects the number of areas represented in the evidence, not their development maturity.

## 2. Implementation Status: Evidence Review

The chart separates areas with evidence in the reviewed sample workbook or code excerpts from areas that appear in documentation/event specifications but whose implementation could not be verified.

| Status category | Count | Share |
|---|---|---|
| Evidence in sample data / code excerpt | 10 | 50.0% |
| Implementation not verified from available evidence | 10 | 50.0% |
| **Total inventoried areas** | 20 | 100.0% |

**Key finding:** Implementation status could not be verified for 10 of 20 areas (50%). These areas should not be labelled as implemented or missing without checking the current app and code.

# 3. Module and Feature Inventory

“Evidence available” means a related sample data entity or previously shared code excerpt was reviewed; it is not confirmation of a production deployment.

| Module | Feature area | Evidence status | Evidence / note |
|---|---|---|---|
| Account & Access | User records | Evidence available | Users table in sample workbook |
| Account & Access | Login/authentication flow | Not verified | Login event defined; production flow not audited |
| Course Catalog | Course catalog data | Evidence available | Courses table in sample workbook |
| Course Catalog | Course details page | Code excerpt reviewed | Previously shared React CourseDetails component |
| Course Catalog | Course modules | Evidence available | Modules table in sample workbook |
| Enrollment & Payments | Purchase/enrollment records | Evidence available | Purchases table in sample workbook |
| Enrollment & Payments | Checkout/payment page | Code excerpt reviewed | Previously shared React Payment component |
| Enrollment & Payments | Subscription lifecycle | Not verified | Subscription start/renew/cancel events specified; implementation not confirmed |
| Learning Content & Progress | Video catalog | Evidence available | Videos table in sample workbook |
| Learning Content & Progress | Video progress tracking | Evidence available | Video_Progress table in sample workbook |
| Learning Content & Progress | Favorites | Evidence available | Favorites table in sample workbook |
| Learning Content & Progress | User streaks | Evidence available | User_Streaks table in sample workbook |
| Live Learning & Attendance | Demo booking | Not verified | Event specification only; no confirmed records in reviewed sample |
| Live Learning & Attendance | Demo attendance | Not verified | Event specification only; no confirmed records in reviewed sample |
| Live Learning & Attendance | Live-class attendance | Not verified | No actual attendance rows in reviewed sample |
| Assessments & Projects | Assessment workflow | Not verified | Assessment events specified; implementation/records not verified |
| Assessments & Projects | Project workflow | Not verified | Project events specified; implementation/records not verified |
| Support & Completion | Course switching | Not verified | No confirmed course-switch records/table in reviewed evidence |
| Support & Completion | Certificate generation | Not verified | Certificate events specified; records not verified |
| Support & Completion | Support tickets and resolution | Not verified | Support events specified; ticket records not verified |

## 4. Findings, Limitations and Next Steps

• **Module distribution:** 20 feature areas grouped into seven module families based on reviewed data, code excerpts and documentation.

• **Evidence coverage:** 10 areas have related sample-data or code-excerpt evidence. This does not prove full production implementation.

• **Unverified status:** 10 areas are present in event specifications or related documentation, but implementation could not be verified.

• **Sample data gaps:** Previous audit materials noted missing attendance, demo, project and certificate records in the reviewed sample. Missing sample rows do not prove a feature is absent in production.

• **Scope limitation:** This report does not include a fresh live-app walkthrough, full frontend repository audit, backend API testing, deployment check or production database verification.

## Recommended verification before management sign-off

• Review the current deployed web/mobile app with product and engineering owners.

• Map each feature to the actual frontend route/component and backend API or database table.

• Confirm whether each feature is implemented, partially implemented, planned or not implemented.

• Validate production records for demo, attendance, assessments, projects, subscriptions, course switching, certificates and support.

• Update the status chart from verified statuses and recalculate counts and percentages.

**Conclusion:** This report provides a transparent, documentation-based view of CDAX's identified module structure and available implementation evidence. A definitive implementation-status chart requires direct verification against the current application and production code/data.
